APPENDIX 6 Report on Estimated Economic Impacts, David Silverman

Summer's End Group, LLC St John Marina in Coral Bay Economic Impact Model March 3, 2015

An analysis of the 5-year economic benefits/losses to the Coral Bay community as a result of construction of a marina

Preparation and Coordination by David Silverman, CBCC Board Member

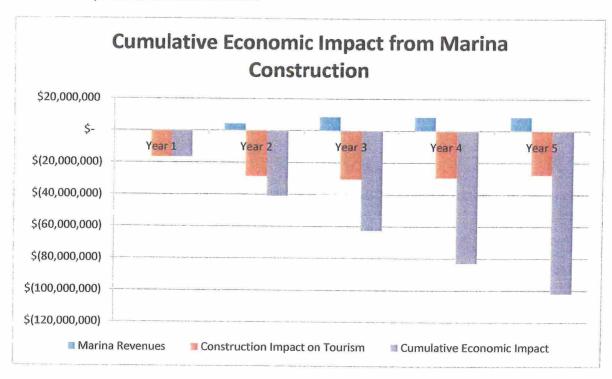

Coral Bay Community Council

Coral Bay Five Year Economic Impact Model: Introduction

In August 2014, the Coral Bay Community Council asked several of its knowledgeable members, all of whom were directly involved in the Coral Bay tourism market, to assess the impacts which the proposed Summers End Group (SEG) marina development would have on the existing economy of Coral Bay. That model demonstrated a net economic loss to the Coral Bay economy of around \$116 million over the first five years of the project.

In February 2015 this model was updated and refined to reflect the availability of better data and more conservative impact estimates. This updated model now indicates a net economic loss of \$101.9 million over the five year span of the model.

The model indicates that Coral Bay business currently adds at least \$52.1 million annually to the territory's economy. This is the amount of income from tourism that is potentially at risk. The Model takes into careful consideration the temporary impacts to tourism caused by construction noise and disruption (which has been presented by many business owners, visitors, and management companies in written letters), as it looks at the net impact of the economic value being added according to the marina developer. Below is a chart which shows the net total impact over 5 years – a negative cumulative impact of \$101.9 million dollars.

Model Methodology

In order to create this model, three sets of data were required. First, the model required an accurate estimate of the size of the existing tourism economy, based on the number and type of rental properties, their average occupancy in low and high season, their average weekly rental rates, and the additional expenditures made by tourists while visiting St John and staying in Coral Bay.

Second, a forecast of the economic benefits of the proposed marina project, based on data supplied by SEG was placed into the model. This data was not subjected to scrutiny, but simply taken as presented by SEG.

Finally, an estimate of the impact which construction of the marina, primarily involving noise and traffic, would have on the appeal of Coral Bay to tourists, and the resulting pressure on the existing economy was needed. This estimate was based on a number of factors - including comments from multi-year tourists, comments from villa owners and property managers who had previously experienced construction impacts, questions in social media, and prior experience of economic downturn during the recession.

Data Points - Existing Tourism Economy of Coral Bay

- 1. Known information about the Coral Bay villa tourism market
 - a. Number of rental villas in Coral Bay quarter (from the website "Vacation Rentals by Owner" or VRBO)
 - Average Occupancy Rate both high season and low season, based on villa manager's experience and review of VRBO booking calendars
 - c. Weekly/Annual Income from Villa Rentals based on actual VRBO average listed rates
 - d. High Season and Low Season dates
 - e. Daily Tourist Spending: Restaurants, Recreation, Automobile Rentals, based on common knowledge of tourist purchasing habits
 - f. Re-expenditure of Rental Receipts by Villa Managers, based on numerous interviews with villa managers on typical management and maintenance expenditures
 - i. Management, repairs, supplies
 - ii. Renovations, cleaning services
 - g. Modest assumptions about growth in number of properties and rental income
- 2. Known information about annual tourism income from commercial properties (Concordia)
- 3. Estimated information about long term rental market (number of properties and receipts)

Assumed Positive Impacts of SEG Project

- 1. SEG's estimate of \$8 million annual economic benefit was not questioned and was put into the model with the time phasing described by SEG (note that this figure has not been justified by SEG, nor has the basis for the figure been explained).
- 2. SEG's claimed construction schedule (18 months) was not questioned and was put into the model (note that every construction manager interviewed for this project believes that SEG's

construction schedule is entirely unrealistic and does not provide any allowance for weather delays, material delays, infrastructure problems, etc.)

Assessment of Marina Construction Impact on Tourism Market

- As construction noise and disruption commence, tourism is immediately impacted (Coral Bay is valued as a quiet ecotourism destination)
 - a. Occupancy rates drop
 - b. New villa construction stops
 - c. Rents stay static as competition for fewer customers depresses prices
 - d. Tourists share "bad experiences" on Trip Advisor and other online travel sites
- After construction completes the market will return, but more slowly than it departed. Many tourists have said they will not return if the marina is built. New customers will need to be found to replace those who have left the market.

Conclusions

- 1. The "No Development" scenario compared to the "Marina Development" scenario indicates the following economic impacts:
 - a. On a NET BASIS (marina gains less tourism losses), the economy of Coral Bay (and St John) will suffer a loss in every year of the model.
 - i. Year 1 shows a Net Loss to St John of \$16.6 million
 - ii. Year 2 shows a Net Loss to St John of \$24.3 million
 - iii. Year 3 shows a Net Loss to St John of \$21.7 million
 - iv. Year 4 shows a Net Loss to St John of \$20.6 million
 - v. Year 5 shows a Net Loss to St John of \$18.8 million
 - The negative Economic Impact to the existing Coral Bay tourism economy over five years is a LOSS of \$132.7 million
 - c. The positive Economic Gain from marina operations over five years is a GAIN of \$30.765 million
 - MET ECONOMIC IMPACT to Coral Bay (and St. John) over five years is a NET LOSS of \$101.9 million
- 2. The SEG claim of 90 jobs created, when phased according to construction plans, and when combined with job losses from existing businesses, results in the following job impacts:
 - a. Year 1 shows a Net Decrease in Jobs of 21 Jobs
 - b. Year 1 shows a Net Decrease in Jobs of 24 Jobs
 - c. Year 3 shows a Net Decrease in Jobs of 8 Jobs
 - d. Year 4 shows a Net Increase in Jobs of 16 Jobs
 - e. Year 5 shows a Net Increase in Jobs of 39 Jobs
